

ABSTRACT

A container has mating top and bottom portions that fit together to exteriorly provide an overall shape of a motor vehicle, and to interiorly define a cavity that contains a plurality of unwrapped food pieces. Preferred containers have appropriate colors, logos, entrant identifying numerals and so forth for a racing car. The top and bottom sections can be hinged, and can include a quick-release mechanism that assists in opening the cavity. The cavity preferably contains at least 25, or more preferably 50, 75 or even more pieces of substantially fungible mint or gums. Mints are especially preferred pieces, as are automobile shaped pieces. The mint or gums can be freely movable within the cavity, as opposed for example, to being contained within a bag, or individually sealed such as would be the case with taffy or other sticky products.
